August 5, 2026

Dear Hiring Manager,

I'm writing to express my strong interest in the **Principal AI Engineer — Generative AI Platforms** position at **ABB's Process Automation Digital Organization**. With 12+ years of software engineering experience — including 4+ years designing and deploying production-grade **Generative AI systems, Agentic AI workflows, RAG pipelines, and cloud-native AI platforms** — I'm excited about the opportunity to build enterprise-scale AI solutions that transform industrial operations.

Generative AI platform engineering is my core domain. As Staff AI Architect in the AI Center of Excellence at GE HealthCare, I design and deploy end-to-end GenAI applications — LLM integrations, Retrieval-Augmented Generation pipelines, Agentic AI workflows with MCP protocol, and AI APIs serving enterprise workloads. I've built multi-agent systems using LangGraph with tool-calling, self-correction mechanisms, and multi-step reasoning achieving ~95% task success rate. My production RAG system delivers hybrid retrieval (embeddings + semantic search) across 10,000+ documents with sub-second P95 latency. I've implemented prompt engineering best practices, evaluation frameworks (LangSmith), AI governance, model monitoring, responsible AI guardrails (Bedrock Guardrails for PII/content filtering), and secure deployment strategies — exactly the end-to-end AI lifecycle this role demands.

On cloud-native platforms and engineering excellence: I've designed scalable AI platform architectures using Python, Kubernetes (EKS), CI/CD pipelines, Docker, and cloud-native technologies — operating data platforms processing 10TB+ daily at 99.9% uptime. I've built reusable AI component libraries (agent templates, prompt libraries, evaluation harnesses) adopted across multiple product teams, driving 25% faster development cycles. I regularly use AI-assisted development tools (GitHub Copilot, Claude Code) and have led a 500+ pipeline migration delivering $2M+ annual savings and 3x performance improvement — demonstrating the ability to drive large-scale technical initiatives with measurable impact on operational efficiency.

Cross-functional collaboration and technical leadership are how I operate. I've partnered with Product Management, AI/ML Engineering, Data Science, Platform Engineering, and Software Engineering teams to define solution architectures and translate product requirements into production systems. I mentor 8+ engineers on Generative AI patterns, lead architecture standards and design reviews, evaluate emerging AI technologies (GraphRAG, MCP, A2A), and continuously improve software quality and developer productivity across the organization. My background in industrial-scale data systems at GE HealthCare — where reliability, safety, and compliance are non-negotiable — aligns naturally with ABB's mission-critical industrial automation context.

ABB's vision of driving industrial transformation through AI-enabled platforms and cloud-native technologies resonates deeply with my experience building intelligent systems that operate at enterprise scale with strong governance. The opportunity to apply Generative AI and Agentic AI to industrial automation — helping industries run leaner and cleaner — represents exactly the kind of high-impact, production-grade AI engineering I thrive on. I'd welcome the opportunity to discuss how my expertise in AI platform architecture and cross-functional delivery can accelerate ABB's digital transformation agenda.

Warm regards,

Shubhashis Sinha
